The polynucleotide, which is a secreted EST, and the encoded protein are predicted to have useful biological activities which would make them suitable for treating, preventing or ameliorating medical conditions in humans and animals, although no supporting data is given. Suggested activities include nutritional activity, immune stimulating or suppressing activity, haematopolesis regulating activity, tissue growth activity, activin/inhibin activity, chemotactic/chemokinetic activity, haemostatic and thrombolytic activity, receptor/ligand activity, anti-inflammatory activity, cadherin/tumour invasion suppressor activity, tumour inhibition activity. The polynucleotide may also be useful for gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1987
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Agostino 1

CC initiation codons, genomic flanking regions, intron-exon borders, the CC initiation codons, genomic flanking regions, intron-exon borders, the CC initiation codons, genomic flanking regions, intron-exon borders, the CC initiation codons, genomic flanking regions, intron-exon borders, the CC or more diseases, conditions or mixtures. The antisense oligonucleotides compared from sequences x55272-74. These multiple target CC oligonucleotides (specifically x55100-271) can be used for the antisense CC treatment of diseases and conditions. Typical diseases and conditions concluding lung diseases, pulmonary vasconstriction, inflammation, CC including lung diseases, pulmonary vasconstriction, inflammation, CC allergic rhinitis, acute asthma, allergies, asthma, impeded respirator, respiratory diseases (COPD), and cancers such as leukemias, lymphomas, CC respiratory disease (COPD), and cancers such as leukemias, lymphomas, CC carcinomas eg. colon cancer, breast cancer, melanoma, hepatic metastases, as well as all types of cancer, melanoma, hepatic contastases, as well as all types of cancers which may metastasize or have

directed against at least 2 mRNAs selected from target genes, coding and non-coding regions of RNAs corresponding to target genes, gene initiation codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'-end and the juxta-section between coding and non-coding regions and all segments of RNAs encoding proteins associated with one or more diseases, conditions or mixtures. The antisense oligonucleotides may be derived from sequences x55272-74. These multiple target oligonucleotides (specifically x55180-771) can be used for the antisense treatment of diseases and conditions. Typical diseases and conditions are those associated with impaired respiration and inflammation, including lung diseases, pulmonary vasoconstriction, inflammation,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is a DNA encoding Epstein Barr virus Nuclear Antigen 1 (EBNA 1), which is obtained from commercially available plasmid pcMyEBNA. EBNA 1 protein is used to stably maintain episomes containing EBV origin of replication (oriP) and a gene encoding protein or RNA of interest. Eucaryotic host cells expressing EBNA 1 protein are transfected with these episomes to produce recombinant cell lines expressing multiple genes of interest. This provides a rapid and reliable method of stably expressing multiple genes in transfected cells. The episomes are useful in the transfection of genes encoding receptors, transporter proteins, ion channels, adhesion molecules and transcription factors. The episomes carrying desired genes can also be used to transfect cells in gene therapy, antisense therapy, for gene amplification, cell immortalisation, etc.

The invention relates to subunits cellulose synthetic equipment, that can be used to increase the amount cellulose synthesised by a plant. The proteins and genes encoding them can also be used to improve the properties of the cellulose being produced by a plant.

                                                                                                                                                       1718
                                                                                                                                                                                                                                  1658
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a method for diagnosing a disorder characterised by expression of a human cancer associated antigen precursor coded for by a nucleic acid molecule (NAM). The method comprises: (a) contacting a biological sample isolated from a subject with an agent that specifically binds to the NAM, an expression product or a fragment of an expression product complexed with an HLA molecule; and (b) determining the interaction between the agent and the NAM or the expression product as a determination of the disorder. The products and methods can be used in the diagnosis, monitoring, research, or treatment of conditions characterised by the expression of various cancer associated antigens. The invention provides nucleic acid sequences and encoded polypeptides which are cancer associated antigen precursors expressed in human breast cancer, renal cancer, colon cancer, gastric cancer, prostate cancer and
                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 789

                             CC Insert. The invention provides a method for increasing the resistance of a core protein to proteolytic degradation that comprises linking or inserting onto or into the core protein a stabilising polypeptide of CC inserting onto or into the core protein a stabilising polypeptide of CC formula [(Glya)X(Glyb)Y(Glyc)Z]n where Glya, Glyb, Glyc are 1-6 CC sequential Gly residues and X, Y, Z are Ala, Ser, Val, Ile, Leu, Met, CC Phe, Pro or Thr and n can be anything between 1-65. X, Y and Z need not be identical from n repeat to n repeat. Alternatively a nucleic acid concoding the stabilising polypeptide can be linked onto or inserted into CC a nucleic acid encoding a core protein. The fusion proteins of the CC invention are more resistant to degradation by proteases and, thus, have CC a longer half-life than the unfused core protein. The products can be cused for treating autoimmune diseases, cancer and inflammation. In CC particular, the core protein may be an IxappaB regulator protein for the treatment of inflammatory bowel disease, or a nitroreductase protein CC which can activate nitro drugs in enzyme/prodrug therapy to treat cancer or other pathological conditions. The fusion proteins can also be used in vevo imaging.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 밁

EBNA 1 protein is used to stably maintain episomes containing EBV origin of replication (orif) and a gene encodin protein or RNA of interest. Eucaryotic host cells expressing EBNA 1 protein are transfected with these episomes to produce recombinant cell lines expressing multiple genes of interest. This provides a rapid and reliable method of stably expressing multiple genes in transfected cells. The episomes are useful in the transfection of genes encoding receptors, transporter proteins, ion channels, adhesion molecules and transcription factors. The episomes carrying desired gene can also be used to transfect cells in gene therapy, antisense therapy, for gene amplification, cell immortalisation, etc.

                                                                                                                      1253
                                                                                                                                                                                                                                                                                           7903
                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 8705 BP; 1875 A; 2575 C;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This invention describes a novel method for generating an antisense library targeted to a selected RNA transcript. The methods can be used for identifying antisense agents and for identifying target sites for antisense mediated inhibition of a selected gene. The use of a direct library for target site selection significantly simplifies the screening process, since only very small libraries need be prepared and assayed. This sequence represents the vector pShuttle which is used in the method
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Claim 16;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       agents and inhibition

This polynucleotide comprises the DNA sequence of vector plasmid pCMVKmITR-EPI, which contains an Epstein-Barr virus (EBV) origin of replication from plasmid pCEP4, a coding region for EBV nuclear antigen A from pCEP4, a pair of inverted terminal repeats from adeno-associated virus, a cytomegalovirus enhancer/promoter, a bovine growth hormone polyA sequence, and a kanamycin resistance selectable marker. Polynucleotides encoding polypeptides, such a crythropoletin or leptin, and ribozymes and antisense polynucleotides can be inserted into the vector. The vector is
                                                                                                                                                 Polycationic agents based on alpha-amino acids, able to complex with nucleic acid - to facilitate its entry into cell, condense and protect it against serum degradation, particularly for use
                                                                                                                                                                                          WPI;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  agents are used to increase the frequency of uptake of a nucleic acid (see also V2184-86) into a cell. The polycationic agent can condense with the nucleic acid and inhibit serum and/or nuclease degradation of the nucleic acid. The nucleic acid can be a vector, may express a therapeutic protein or a vaccinating viral or cancer antigen, or is itself therapeutic (antisense or ribozyme). The methods and compositions can be used in the gene therapy of many diseases.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              6479
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                6359
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a cell transfected with a gene encoding a G_i protein coupled receptor (G_iPCR) and with a gene coding for a G_ia protein capable of coupling to the G_iPCR, to increase the cytoplasmic calcium upon binding of an agonist to the G_iPCR. The cell is used to assay a test compound for its effect on a G_iPCR. The method and cells are useful for assaying agonist and antagonist compounds, which bind to G_iPCR which, stimulate intracellular calcium mobilization, such as the nocloeptin receptor, and particularly chemokine receptors such as CCR3, CCR2 and the interleukin 8 receptor type B. The present sequence represents the nucleotide sequence of the pCEP4 vector.
                                                                                                                                                                                                                                                                                                                                                  6659
                                                                                                                                                                                                                                                                                                                                                                                                       1373

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Plasmid pCisEBON (a pRK5 derivative) is an episomal CMV driven expression plasmid. HuHGF variants with enhanced receptor binding activity were produced by site-directed mutagenesis. Stable populations of preferred HGF variants were obtained by transfecting human embryonic kidney 293 cells and then these were subcloned in pCisEBON. See R52940-R52949 for examples of pref. HGF variants.

This sequence represents the episomal CMV driven expression plasmid CC growth factor (HGF). HGF is isolated from human serum and is a CC disulphide linked heterodimer derived by proteolytic cleavage of the CC pro-hormone between residues 494 and 495. This generates a molecule CC composed of an alpha subunit of 440 amino acids (mol. wt. 69 kD) and CC a beta subunit of 234 amino acids (mol. wt. 34 kD). The appha and beta contains four kringle domains based on their homology to kringle-like CC domains in other proteins, e.g. prothrombin, plasminogen. The alpha subunit CC contains in other proteins, e.g. prothrombin, plasminogen. The beta CC subunit shows high homology to the catalytic domain of serine proteases. CC However two of the three residues which form the catalytic triad of CC serine proteases are not conserved in HGF. Therefore, the precise CC function of the beta chain remains unknown. The invention includes HGF covariants which retain HGF receptor binding activity without having the biological activity of wild-type HGF. They can be used for the treatment CC of pathological conditions associated with the activation of a HGF creeptor such as malignancies associated with chronic HGF receptor CC activation. The polismin comprising the HGF coding sequence confidence of the variant HGF's of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match
